Executive Summary

For our Stakeholders

Hardhat Enterprises is an organization that aims to create cyber weapons and tools that can be used to empower white-hat operations. All deliverables produced by the company will be open source so that anyone may use and benefit from them. These deliverables should either improve on existing tools or fill a market need that is not yet met.

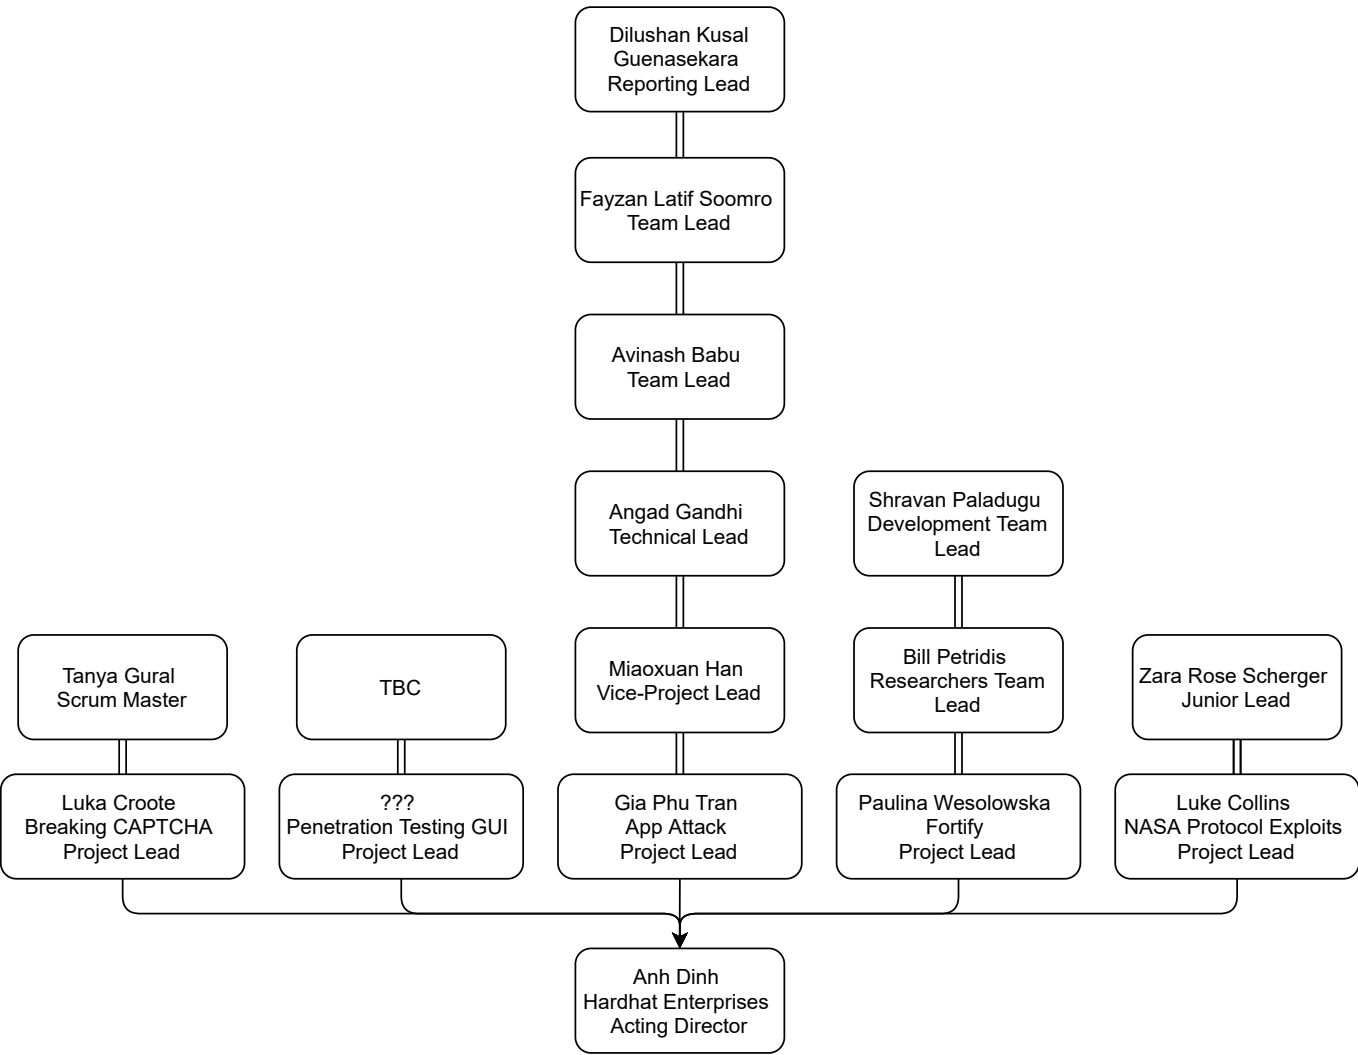

For our Employees

Hardhat Enterprises will aim to provide its employees with opportunities to:

- Build up their skills and knowledge.
- Create meaningful connections.
- Produce meaningful deliverables that will showcase their abilities.

Leadership Team

The below outlines the membership of the leadership team for this trimester:

Trimester Goals and Objectives

This trimester Hardhat Enterprises aims to:

- Achieve an engaging learning experience for students within the company.
- Achieve an opportunity for students to gain cross-department/project experience and the chance to share their expertise outside of their project team.
- Continue maturing the five projects; AppAttack; Breaking CAPTCHA; Fortify; and NASA Protocol Exploits. These projects will continue into future trimesters and allow students to showcase their skills. All projects will be open source for students to show to future employers.

Company Structure and Projects Overview

This trimester (T3/2022), the company is working on five different projects, each supporting the goals of the company in a different way.

Breaking CAPTCHA

Overview, Goals, and Objectives

The goal of the Breaking CAPTCHA project is to develop machine learning, AI, and computer vision models to autonomously solve CAPTCHA problems. The final product of the project will be to provide end users with an interface to solve these CAPTCHA problems. This user interface will be the focus of future iterations. The Hardhat Director wants a product that improves upon current open-source solutions for this problem. As a result, the models to be produced will need to be either more accurate, reliable, or solve a novel issue facing current CAPTCHA solving models. This will be done through several steps, including research and development, creating of models, and deployment of models as well as engineering of deployment and model pipelines. This will be supported by cloud infrastructure developed to solve storage, processing, DevOps and handover issues allowing for the production of 'infrastructure as code' artefacts.

Aims for Trimester

The project aims for this trimester are to leverage the learnings of previous work as well as the current capability of the team. Our trimester deliverables will be: •

- Infrastructure as code product to enable efficient handover of cloud infrastructure.
- Improving the performance of the Machine learning model that breaks Audio CAPTCHAs.
- Developing novel methods for solving Audio CAPTCHAS
- Progressing the development of a non-segmentation model that will break text CAPTCHAs.
- An Improved pipeline which connects R&D and UI deliverables through Machine Learning pipelines, CI/CD pipelines and improved infrastructure.
- Improving the showcase website in both usability and runtime.

Deliverables

Trimester Deliverables

- Text and Audio CAPTCHA breaking black box models which are versioned and operationalised
- Improved performance of CAPTCHA breaking models
- Improved runtime of Cloud based solutions
- Connectivity between R&D and Products using Cloud resources as well as CI/CD and ML pipelines
- Improved Documentation of progress to date
- Improved analysis of state of the art of the Breaking CAPTCHA
- Possibly research and proof of concept solutions for cognitive reasoning based CAPTCHAS

Long Term Deliverables

- An end user product that will allow a user to solve CAPTCHA in real-time with minimal human input
 - App or website

- Chrome Extension

App Attack

Overview, Goals, and Objectives

Deakin's OnTrack online application will undergo secure code review and web application penetration testing from AppAttack. The objective is to deliver a comprehensive security report to Deakin that includes the identification of vulnerabilities and recommendations for application and code hardening.

The AppAttack project for this trimester will begin from scratch. Except for retesting prior findings, earlier iterations and deliverables won't be carried over into this trimester.

Additionally, the goal of AppAttack is to provide internal deliverables to support subsequent rounds of AppAttack and deliverables of value to our customer Deakin. Internal deliverables aim to develop a methodology, frameworks, report templates, a centralized knowledge base, and exploitation tools to speed up client deliverables and increase the range of services and products offered by AppAttack.

Aims for Trimester

- Build a testing environment
- Improving our testing environments
 - Each subteam will dive deep into one particular part of OnTrack (like authentication, APIs)
 - Provides instructions on replicating the updated environment.
 - Allow the next trimester can do the work continuously and not restart.
- Perform penetration testing on OnTracks in an attempt to find working exploits for vulnerability
 - Both successful and unsuccessful exploits should be recorded and discussed, including the process of trial and error that was used to reach a working exploit
- Provide analysis for OnTrack codebase's security
 - Provide recommendation for both vulnerable and potential dangerous
- Develop procedures, templates, and techniques.
- Create an experience that is comparable to the industry for students to emphasise on resumes when applying for high-caliber professions.
- Add value for stakeholders, clients, and students.
- Offer Deakin University deliverables that are worthwhile.

Deliverables

- Deliver a Web Application Penetration Testing Report and Secure Code Review to Deakin University meet the industry standard.
- Cover all parts of OnTrack's codebase

Fortify

Overview, Goals, and Objectives

Fortify is a platform that connects volunteer cyber security professionals with organisations that need assistance building their system security. Fortify attempts to address security flaws and problems that typically affect small enterprises and non-profit organisations that lack the resources to hire a skilled cyber security team. The goal of Fortify is to connect these companies with qualified volunteers who can help raise awareness of cyber security practises, give them the chance to evaluate their present security posture and strengthen their security capabilities, and giving the volunteers the opportunity to showcase their cyber expertise and broaden their network. It's also vital to note that the Fortify's long-term goal is to become a non-profit organisation that promotes its services all throughout Australia, improving overall security and defending against cyber-attacks. The Fortify project for this trimester builds on existing work finalised in previous trimesters and aims to summarise it, fill the gaps and create a comprehensive report that describes all business operations from start to finish.

Aims for Trimester

- Update the existing website designs and mock-ups
- Create a comprehensive plan on how to build a website and a database in a secure manner.
- Start the work on developing the website
- Build a questionnaire for clients based on Essential 8
- Create a report showcasing all business procedures with use cases
- Create selection criteria for becoming a volunteer

Deliverables

• Improved design of the website • Research and proof of concept solutions for Fortify website and database • The landing page and environments for the website • Developed and refined cyber security assessment questionnaire and scoring matrix • A clear and comprehensive report with the plan and explanation of all business operations

NASA Exploits Project

Overview, Goals, and Objectives

The NASA Protocol Exploits project consists of a team of students that aim to evaluate and investigate the current implementation of the Interplanetary Overlay Network (ION) environment provided by the NASA JPL team. The motivation behind this project stems from the sensitive nature of data communicated over satellites, which typically have 'security' low on the priority list. Our overall goal is to analyze the source code and environment to identify various vulnerabilities in the protocols and systems used for space communications and to ultimately document successful exploitations, the methodologies behind them, and potential remedies.

Aims for Trimester

The NASA Protocol Exploits team aims to advance the project in three different areas over T3 of 2022. The three areas the project seeks to improve are as follows;

Static Code Analysis - The static analysis team, given the nature of work, carried out in previous trimesters and the list of vulnerabilities generated via automated vulnerability/defect services such as Coverity. The group aims to work through the highest-priority vulnerabilities and document their findings alongside reviewing several aspects of the environment's source code. Some tasks include but are not limited to:

- Reporting on the validity of previously detected vulnerabilities.
- Reporting the potential impact of such vulnerabilities.
- Providing potential remedies and/or code fixes.
- Developing and deploying exploits from said vulnerabilities.

Dynamic Code Analysis - The dynamic analysis team aims to continue developing and deploying various fuzzing tools/techniques from the last trimester. The goal is to attack the testing environment to see multiple protocols within the DTN stack react and report on the findings. Some tasks include but are not limited to:

- Developing various fuzzing tools using python libraries.
- Developing various attack scenarios.
- Reporting on the techniques used and experiment findings.

Improve Company Documentation / Environment - All project members aim to improve the overall quality of training materials, and the current way documentation is kept with the end goal of migrating resources to GitHub. Some tasks include but are not limited to:

- Contributing to the NASA Exploits Project GitHub.
- Converting older resources in SharePoint to markdown for better source control.
- Improving the current state of training material / junior onboarding process.
- Improving the current state of the testing environment.

Deliverables

Trimester deliverables for the following teams:

1. Static Analysis Team:

- Vulnerability Reports and Findings
- Exploits?!
- 2. Dynamic Analysis Team:
 - Fuzzing Scripts for the following protocols; CFDP, AOS, BP, and LTP.
 - Vulnerability Reports.
 - Experiment Finding Reports.
 - Attack Scenarios.
- 3. Project Leadership / Contributing Members:
 - Company Handbook on GitHub.
 - Updated Training Resources.
 - Various Frameworks for vulnerability identification and Reporting

Long-Term Deliverables for the project:

1. Successful exploitation of the protocol, potential real-world satellite interception.
2. Write/Submit a script to automatically exploit the protocol or intercept satellite communications.
3. Create a resource pool for the future extensibility of the project.
4. Present research findings and remediation recommendations to NASA.
5. Attain access to the full version of ION.

Project Members

[Please see appendix D - NASA Exploits Project](#)

Appendix A

Breaking Captcha Team Members

Name	Role
Luka Croote	Project Lead
NGUYEN NGOC BACH LUU	Text CAPTCHA R&D
Jamil Rizkallah	Audio CAPTCHA R&D
Inder Singh	Audio CAPTCHA R&D
Fenglu Cai	Audio CAPTCHA R&D
Tanya Gural	Cloud/DevOps Engineer, Scrum master
Ridwan Ganiyu	Audio CAPTCHA R&D
Koshila Dodantenna	Cloud Engineer

Appendix Penetration Testing GUI Team Members

Name	Role
???	Project Lead
Other Members	Other roles

Appendix C

App Attack

Name	Role
Gia Phu Tran	Project Lead
Miaoxuan Han	Vice Project Lead
Angad Gandhi	Team Lead, Technical Lead
Avinash Babu	Team Lead
Fayzan Latif Soomro	Team Lead
Dilushan Kusal Gunasekara	Penetration Tester, Reporting Lead
Dilshan Wickramasinghe	Penetration Tester
Suntosh Mudaliar	Penetration Tester
John Patrick Thomas	Penetration Tester
Shavon Martin	Penetration Tester
Kevin Nguyen	Penetration Tester
Rusith Siriwardena	Penetration Tester
Matthew Shiroodi	Penetration Tester
Gleb Spektor	Penetration Tester
Jack Sievers	Penetration Tester
Beau Williams	Penetration Tester
Pamudu Wickrama	Penetration Tester
Oliver Power	Penetration Tester
Olivia Vosdoganis	Penetration Tester
Ashen Udara Madurawala	Penetration Tester
Mitchell Burcheri	Penetration Tester
Muhammad Saim Khan	Penetration Tester
Diomedes Dio Kyrou	Penetration Tester
Vick Kumar	Penetration Tester

Appendix D

Fortify Team Members

Name	Role
Paulina Wesolowska	Project Lead
Shravan Paladugu	Team Lead
Abigail Chong	Development Team
Ali Adil Abdulrazzaq Al-Kinan	Development Team
David Wang	Development Team
Harry Singh	Development Team
Nadia Maharani Azhari	Development Team
Tom Edmondson	Development Team
Bill Petridis	Team Lead
Aayush Talwar	Research Team
Kevin Kidd	Research Team
Luke Newton	Research Team
Manav Lath	Research Team
Muhammed Khudruj	Research Tea
Ranjan Weerasinghe	Research Team

Appendix E

NASA Exploits Project Team Members

Name	Role
Luke Collins	Project Lead
Zara Rose Scherger	Junior Project Lead
Yongxiang Huang	Researcher
Connie Cox	Researcher
Jesse Ludeman	Researcher
Izaz ishaque	Researcher
Tristen Clifton	Researcher
Andrew Eymard	Researcher
Yizhou Feng	Researcher
